

RadMorphs

Date	Changes
2024-07-30	Added link to dashboard resource summary page

Narrative:

You've gathered **Elements**, and fused them into **RadGems**. You've collected **Morph Energy Cards** that inspire you. Now *you* make the choice which **RadGems** and **Card** you want to craft into a final **RadMorph**.

Jetty will help combine **2 RadGems** with the power of **1 Morph Energy Card** to produce your **Radmorph**.

The **card** you choose will determine its *shape*, and the **gems** its two *colors* and final *material* appearance. Treasure your RadMorph always (or trade it to somebody who will!)

Radmorphs are *completely determined* by the gems and card that are consumed to create them. They also have their own *quality* that is simply determined by the sum of the qualities of the 3 ingredients that went into it. So we give Radmorph *quality* some special descriptive words:

Radmorph *quality* descriptor for ranges of quality:

- Exquisite
- Superb
- Excellent
- Fine
- Basic

Game mechanic:

RadMorphs are the final collectible NFT that players aspire to. They are produced from **2 RadGems** and **1 Morph Energy Card**. They are never provided directly as a reward, or directly included in a Gift Box.

A RadMorph is a deterministic combination of the Card and RadGem ingredients that went into it.

We've created animated images of all possible combinations of:

- 1 shape
- 2 colors
- 1 material

To determine what combination to use to pick the image based on the ingredients used:

- The shape is defined by the Energy Card
- The 2 colors are determined by the colors of the 2 RadGems. This can include 2 of the *same color*.
- The material is determined by the *more rare* of the materials of the 2 RadGems. Radiant trumps Metallic trumps crystalline

The RadMorph also has its own quality. This is simply the sum of the qualities of the Card and 2 RadGems. So if Cards have a quality range of 1-50 and RadGems have a quality range of 1-25, then RadMorphs have a quality range of 3-100. The final quality is also used to select the quality descriptor listed above, used in the RadMorph name/description.

radgem2_material	[radgem2 material]	radiant

radgem2_rarity	[radgem2 rarity]	ultra-rare
radgem2_quality	[radgem2 quality]	20

Because of the large quantity of Radmorphs, a coding system is used so that the filename used in the `key_image_URL` may be *automatically* set based on the components that went into the Radmorph. That naming system is defined here (the FILE NAME) in particular in the lower right. Don't pay attention to the common/rare/super rare assignments shown - we will likely change these assignments:
